

DATA EXPORT

Standard Export Methods

Standard Export Methods Included in the core Lims1 system include a range of data export capabilities which employ standard **csv files** and/or **MS-Excel** for export of data.

Examples

Job Registration – Results of Analysis

MS-Excel spreadsheets of results for a given Job Registration created and linked to client emails.

Job Registration – Reports

csv files, developed using the Lims1 Report Format Generator may be created for distribution to clients.

Lims1 dbQuery Module

The dbQuery Module provides Lims1 users with the ability to create complex database queries based on selection of a range of data field filters. Data extracted may then be exported as **csv files**. For example, Export Macro's may be created by the laboratory to extract sets of results information based on sets of sample information and dates.

Invoice/Accounts Reports

The Lims1 Invoice/Accounts Module provides **csv file** data export capabilities with user established data export formatting capabilities.

Custom Developed Export Methods

In addition to the above LTech can develop/provide custom data export capabilities to meet individual laboratory requirements for Import into Third Party Software or Corporate/In-house databases. These applications often take the form data extraction routines which scan the database for specific sample information and extract a range of results information on a regular basis.
